

# CITY OF ATWATER

## COMMUNITY DEVELOPMENT AND RESOURCES COMMISSION

### AGENDA

Council Chambers  
750 Bellevue Road  
Atwater, CA 95301

**December 20, 2017**

CALL TO ORDER: (Council Chambers)

6:00 PM

PLEDGE OF ALLEGIANCE TO THE FLAG:

INVOCATION:

ROLL CALL:

Dash\_\_\_\_, Daugherty\_\_\_\_, McWatters \_\_\_\_, Murphy III\_\_\_\_, Reed\_\_\_\_,

Warchol\_\_\_\_, Brice\_\_\_\_

SUBSEQUENT NEED ITEMS: (The Recording Secretary shall announce any requests for items requiring immediate action subsequent to the posting of the agenda. Subsequent need items require a two-thirds vote of the members of the Commission present at the meeting.)

APPROVAL OF AGENDA AS POSTED OR AMENDED: (This is the time for the Commission to remove items from the agenda or to change the order of the agenda.)

CEREMONIAL MATTERS: None

COMMENTS FROM THE PUBLIC:

#### NOTICE TO THE PUBLIC

At this time any person may comment on any item which is not on the agenda, that is within the jurisdiction of the Community Development and Resources Commission. Please state your name for the record. Action will not be taken on an item that is not on the agenda. If it requires action, it will be referred to staff and/or placed on a future agenda.

To comment on an item that is on the agenda, please wait until the item is read for consideration; please limit comments to a maximum of three (3) minutes.

Civility is expected from members of the public during the meeting. For more efficient use of time, disruptive behavior will not be tolerated. While you may not agree with what an individual is saying, please treat everyone with courtesy and respect.

APPROVAL OF MINUTES: None

PETITIONS AND COMMUNICATIONS:

1. **Request from Kiwanis Club of Castle-Atwater to place "Little Free Library" at Heller Park**

**Staff's Recommendation:** Motion to authorize request from Kiwanis Club of Castle-Atwater to place "Little Free Library" at Heller Park, and refer to the City Council for approval.

PUBLIC HEARINGS: None

REPORTS AND PRESENTATIONS FROM STAFF:

2. **Presentation of Architectural Materials for 7-Eleven Convenience & 76 Fuel Project to the Architectural Control Committee for Review and Comment**

**Staff's Recommendation:** Review the proposed project materials and design elevations for proposed 7-Eleven Convenience & 76 Fuel Project prepared and provided by Smith Development; and

Compare the proposed project materials for consistency with the Commercial and Industrial Design Guidelines as Adopted October 8, 2012; and

Adopt Resolution No. XXXX-17 and direct staff to Coordinate and process applications for demolition and building permit; and Administer and support all municipal guidelines and standards; and Collect all appropriate fees; or

COMMISSIONER MATTERS:

3. **Community Development and Resources Commissioners Comments**

ADJOURNMENT:

CERTIFICATION:

I, Lori Waterman, Community Development and Resources Recording Secretary, do hereby certify that a copy of the foregoing Agenda was posted at City Hall a minimum of 72 hours prior to the meeting.

\_\_\_\_\_  
LORI WATERMAN, CMC  
RECORDING SECRETARY

SB 343 NOTICE

*In accordance with California Government Code Section 54957.5, any writing or document that is a public record, relates to an open session agenda item and is distributed less than 72 hours prior to a regular meeting will be made available for public inspection in the office of the City Clerk at City Hall during normal business hours at 750 Bellevue Road.*

*If, however, the document or writing is not distributed until the regular meeting to which it relates, then the document or writing will be made available to the public at the location of the meeting, as listed on this agenda at 750 Bellevue Road.*

*In compliance with the Federal Americans with Disabilities Act of 1990, upon request, the agenda can be provided in an alternative format to accommodate special needs. If you require special accommodations to participate in a City Council, Commission, or Committee meeting due to a disability, please contact the City Clerk's Office a minimum of three (3) business days in advance of the meeting at 357-6300. You may also send the request by email to [lwaterman@atwater.org](mailto:lwaterman@atwater.org).*

KIWANIS CLUB OF CASTLE-ATWATER

P.O. BOX 781

ATWATER, CA 95301-0781

October 31, 2017

To: Brian Shaw, Acting Public Works Director

Subject: Little Free Libraries

The Kiwanis Club of Castle-Atwater is interested in starting a new project called "Little Free Library". In order to be successful the project requires both coordination with and permission from the City of Atwater.

We are exploring Heller Park as a location since it meets the important criteria of being in a neighborhood with children and a close proximity to a school. We would defer to your judgement on the exact looking, but it obviously need to be away from sprinkler systems.

The non-profit organization behind this program has numerous different plans for the construction of the Little Free Libraries and until we have the necessary permits we have not settled on a specific design. However, we fully intend to work closely with the city to make sure that all the necessary requirements are followed.

Once the Little Free Library is in place, the Castle-Atwater Kiwanis club and the Atwater High School Key club will be responsible for providing the books and the continuing maintenance of the library.

A handwritten signature in black ink, appearing to read 'Adrian Vanderzyde'.

community, and  
sparks creativity by  
fostering  
neighborhood book  
exchanges around  
the world.

**Website**     [littlefreelibrary.org](http://littlefreelibrary.org)

**Little Free Library** aims to inspire a love of reading, build community, and spark creativity by fostering neighborhood book exchanges around the world. There are more than 50,000 registered Little Free Libraries worldwide, in all 50 of the United States and in 70 countries. Through Little Free Libraries, millions of books are exchanged each year, with the aim of increasing access to books for readers of all ages and backgrounds. The Little Free Library nonprofit is based in Hudson, Wisconsin, United States.

## History

The first Little Free Library was built in 2009 by Todd Bol in Hudson, Wisconsin. He mounted a wooden container designed to look like a one-room schoolhouse on a post on his lawn and filled it with books as a tribute to his mother, who was a book lover and school teacher. Bol shared his idea with his partner, Rick Brooks, and the idea spread rapidly, soon becoming a "global sensation" Little Free Library officially incorporated on May 16, 2012, and the Internal Revenue Service recognized Little Free Library as a 501(c)(3) nonprofit organization in the same year.

The original goal was the creation of 2,150 Little Libraries, which would surpass the number of libraries founded by Andrew Carnegie. As of November 2016, there were 50,000 registered Little Free Libraries worldwide.

The Little Free Library nonprofit has been honored by the National Book Foundation, the Library of Congress, Library Journal, and others for its work promoting literacy and a love of reading.

Margret Aldrich wrote *The Little Free Library Book* to chronicle the movement.

## How Little Free Libraries work

A reader browsing a Little Free Library

A Little Free Library is a neighborhood book exchange where anyone passing by can take a book to read or leave a book for someone else to find.

Little Free Library owners, known as "stewards" can purchase a Library box at [littlefreelibrary.org](http://littlefreelibrary.org), or they can create their own and register it on the website.

Stewards of registered Little Free Libraries receive a sign for their Library that reads "Little Free Library" and features an official charter number.<sup>1</sup> Registered Little Free Libraries are eligible to be featured on the Little Free Library World Map, which lists locations with GPS coordinates and other information.

Little Free Libraries of all shapes and sizes exist, from small, brightly painted wooden houses to a larger library based on Doctor Who's TARDIS.

## Global impact

Little Free Library in a Tokyo Metro station

While the majority of Little Free Libraries are in the United States, the book exchanges can be found in countries around the world, including Canada, Mexico, Brazil, Colombia, Italy, Germany, UK, France, Spain, Belgium, Netherlands, Sweden, Russia, Armenia, Pakistan, Qatar, Ghana, Nigeria, Sudan, India, Japan, South Korea, Vietnam, China, Philippines, Australia, New Zealand, and more.

Map to show the location of Little Free Libraries around the world:  
<https://littlefreelibrary.org/ourmap/>

The local map shows one located at 478 E Grove. However the Little Library is no longer there.

There are about seven Little Libraries in Merced and the picture below shows the one on K Street between 20<sup>th</sup> and 21<sup>st</sup> Street.

2

**PRESENTATION OF ARCHITECTURAL MATERIALS FOR 7-ELEVEN  
CONVENIENCE & 76 FUEL TO THE ARCHITECTURAL CONTROL  
COMMITTEE FOR REVIEW AND COMMENT**

**RECOMMENDATION**

It is recommended that the Community Development and Resources Commission take the following actions:

1. Review the proposed project materials and design elevations prepared and provided by Smith Development for 7-Eleven Convenience & 76 Fuel; and
2. Compare the proposed project materials for consistency with the Commercial and Industrial Design Guidelines as Adopted October 8, 2012; and
3. Adopt Resolution No. XXXX-17 and direct staff as follows:
  - a. Coordinate and process applications for demolition and building permit
  - b. Administer and support all municipal guidelines and standards
  - c. Collect all appropriate fees

**BACKGROUND**

The development review process for the proposed project is subject to architectural control review per Section 17.12.090 of the Atwater Municipal Code. As an applicant submits materials for the issuance of a building permit such as site plans, building plans, building elevations and/or landscaping plans they are subject to review for design consistency by the City Building Inspector and the local Planning Authority. The Planning Authority and the City Council gave direction to staff on behalf of the community as to the desired aesthetic qualities they wish to preserve and protect by adopting standards for Commercial and Industrial Design Guidelines on October 8, 2012 by Resolution No. 2675-12 (EXHIBIT "A"). The project would be subject to such review. City staff has completed actions needed to prepare the project for consideration by the Community Development and Resources Commission (CDRC) and the City's Building Inspector. These actions have included preparing and reviewing plans, preparing and reviewing building elevations, preparing and reviewing sign standards and coordinating with other affected agencies. The applicant's project manager has provided project updates and project information, including the necessary applications and processing fees.

Jesse Kent of Smith Development and Construction is the applicant's representative.

**SITE LOCATION AND DESCRIPTION**

**Site Location**

The subject property is located at the Southeast corner of Shaffer Road and Bellevue Road in Northern Atwater. The site consists of an existing Valero brand gas station and convenience store all located on one legal parcel with access from Shaffer Road and Bellevue Road and an alleyway in the rear of the main building location. All City services are provided onsite to the existing business. The improvements consist of fuel dispensaries, canopy covering, main building and underground storage tank.

**Description of surrounding uses**

The areas immediately adjacent to the subject property are General Commercial to the South, East and West, and PD-16 to the North. All existing uses are consistent with the anticipated uses for the project.

**PROJECT DESCRIPTION**

The applicant is requesting that the City issue building permits for the demolition of an existing Valero brand gas station and convenience store and construction of a 7-Eleven Convenience & 76 Fuel brand gas station in its place (EXHIBIT "B"). The project applicant has coordinated other site use applications with other affected agencies. PLEASE NOTE: the applicant is not seeking cancelation of the existing CUP or site use permits associated with this facility. The proposed use under the current application will not render those previously issued permits abandoned.

Respectfully submitted,

*/s/ Lori Waterman*

## Brief History of Atwater

In the early 1850's John W. Mitchell and his brother Asal started buying land from the federal government in the San Joaquin valley portion of the newly formed state of California. Mitchell convinced people from his home state of Connecticut to come west and try their hand at dry-land farming. From buying and selling thousands of acres in the in the San Joaquin valley, Mitchell influenced the early development of the land in the Atwater vicinity.

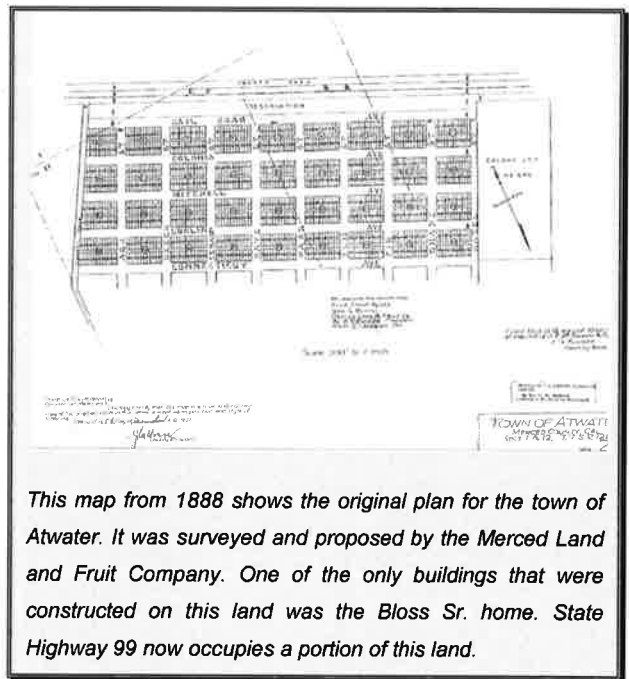

*John W. Mitchell*

In the late 1860's John W. Mitchell prompted Mitchell D. Atwater to make the move from Connecticut to California. As one of the first settlers he farmed on acreage that he rented from Mr. Mitchell. In the early 1870's the Central Pacific Railroad began laying track through the valley on its way to connect to Merced. Mr. Mitchell and Mr. Atwater convinced the railroad to add a spur next to a warehouse where Mr. Atwater

stored his grains. The area became known as the "Atwater Switch". About this time Mr. Atwater purchased his own land northwest of nearby Merced and relocated his family to his new ranch. Mr. Atwater became a diversified farmer farming his ranch for over 30 years and passing away in the early 1900's. Mr. Mitchell passed away in the early 1890's leaving the vast majority of his estate to his three nieces- Mrs. Mary Geer, Mrs. Emma Crane and Mrs. Ella Bloss.

Ella Bloss was the wife of Mr. George Bloss Sr. who settled in the Atwater area in the early 1880's. Mr. Bloss administered the estate that his wife had inherited from Mr. Mitchell. In the late 1880's Mr. Bloss along with Mr. Geer subdivided 480 acres in 20 acre parcels and called the area Atwater Colony. The Merced Land and Fruit Company laid out the town and sold the lots at auction.

*This map from 1888 shows the original plan for the town of Atwater. It was surveyed and proposed by the Merced Land and Fruit Company. One of the only buildings that were constructed on this land was the Bloss Sr. home. State Highway 99 now occupies a portion of this land.*

The Atwater area would be slow to develop, for at the turn of the century only about 100 people lived in the area. The first weekly newspaper, The Atwater Signal, started publication in 1911 and in 1912 the San Joaquin Light and Power Company brought electricity to the area. In 1922 Atwater was incorporated and Mr. George Bloss Jr. was its first mayor.

Despite its slow start the City did indeed develop. The Santa Fe Railroad was laid on the north side of town and later Highway 99 passed through town bringing excellent transportation opportunities. In the early 1940's the Merced Army Flying Field (later Castle Air Force Base) was constructed bringing more people and increased commerce to the area. Situated in the population belt of the valley over half of the County's population is now centered in the Atwater-Merced area.

*In 1899 the Fin de Siecle addition was made to Atwater, this map depicts how Atwater first developed. The Fin de Siecle addition was the beginning of the business district for Atwater. Note that the street names are no longer the same. Elm is now Broadway, Oak is Cedar and Ash is Drakeley. These changes were made sometime prior to 1927.*

From the days of the colony, Atwater is now a fully developed thriving community.

*The City of Atwater is located within the San Joaquin Valley portion of the greater Central Valley of California. Situated within Merced County, the City of Atwater is approximately 8 miles northwest of the City of Merced, the County seat, 110 miles south of the City of Sacramento and 65 miles north of the City of Fresno. As of 2011 the City of Atwater encompassed approximately 5.5 square miles and has a population of approximately 28,000 residents.*

**Waste Water Treatment Plant and City Enterprise Zone:**

Construction of a new wastewater treatment plant (WWTP) began in 2010 and is scheduled for completion in 2012. The project includes construction of a new WWTP at 530 South Bert Crane Road with initial capacity to treat up to 6 million gallons daily (mgd). The new WWTP provides filtration, nitrogen reduction, and ultraviolet light (UV) disinfection of wastewater. Related facilities at the new WWTP site include a biosolids storage/transfer facility, new administration and maintenance facilities, and a stormwater retention pond. The project also includes upgrading the influent pump station and installing odor control facilities at the existing WWTP at 550 Commerce Avenue, and decommissioning and demolition of other remaining structures related to WWTP operations at the existing site.

***WWTP at 530 South Bert Crane Road***

Also in efforts to reduce greenhouse gas emissions and expand the availability of alternative energy resources, a photovoltaic solar facility is being built next to the Bert Crane WWTP. The solar facility includes 204 pole mounted single

axis azimuth trackers supporting twenty 270-watt modules. Combined the 204 trackers will generate a total of 1.1 megawatts of direct current electricity.

***Enterprise Zone in and Around Atwater***

An Enterprise Zone is an economically depressed area in California that is designated as such by the California Trade and Commerce Agency. Certain areas in the City of Atwater are located within an Enterprise Zone (Refer to figure above). The purpose is to encourage and stimulate growth, development, and investment in the area. Enterprise Zones were established in California to provide tax incentives to businesses and allow private sector market forces to revive the local economy. Businesses located in the Enterprise Zone may reduce state income taxes by a limited amount of the sales or use tax paid on certain machinery purchased for exclusive use within the Enterprise Zone. To qualify for the credit, the machinery must be used to manufacture, process, combine or otherwise fabricate a product; or produce a renewable energy source; or control air or water pollution. Data processing and communication equipment are also qualified.

## **Introduction to Commercial and Industrial Design Guidelines**

These design guidelines are intended to inform project designers, decision makers and the public of the City's expectations and preferences for the qualities to be incorporated in the design of new commercial and industrial development. The effective application of these guidelines is intended to result in development projects that respond to the unique characteristics of their individual sites, but that also fit into the wider context of the City.

These guidelines have been prepared because Atwater has become a city with a physical character and identity that is distinct, attractive, and widely appreciated by residents and visitors. At the same time, changes in the nature of business, marketing and the overall economy beyond our community have created pressures for types and styles of commercial and industrial development that have, without strong local guidance, made many other communities lose their distinctiveness and look and feel like everywhere else, and nowhere in particular. Atwater intends to maintain and enhance the character of commercial and industrial districts with attractive and pedestrian-oriented development, and functional and well-designed industrial parks that serve to attract stable, well paying jobs to the City and region.

The purpose of these guidelines is to consider building design, site planning, landscaping, parking layout, signs, and other features that affect a project's function and appearance. In examining these project features, the plan review

process looks at the way a project relates to the site, the surrounding neighborhood, and the community as a whole.

Plan review is intended to help achieve a project that strikes a balance between the sometimes-competing interests of the applicant and the City. The City generally does not dictate particular styles of architecture or design. Instead, the City strives to encourage creativity and architectural variety, while advocating that the new structures are comparable in scale and fit in with its setting and surroundings.

These guidelines shall be used in conjunction with other documents adopted by the City that contain goals, development parameters and more specific regulations relative to a particular type of development. In other words, development projects shall also comply with applicable provisions of the City's General Plan and Zoning Code, applicable sections of the Municipal Code and other adopted standards or plans.

## **Commercial Guidelines:**

### **Applicability:**

These guidelines are advisory for permitted uses but should be used in conjunction with uses such as Tentative Maps, Conditional Use Permits or Planned Development proposals, to encourage the highest level of design quality while at the same time providing the flexibility necessary to encourage creativity on the part of project designers.

### **Site Planning:**

Placement of structures should consider the location of incompatible land uses, the location of major traffic generators, as well as an analysis of a site's characteristics and particular influences.

- Structures should be sited in a manner that will compliment the adjacent structures. Sites should be developed in a coordinated manner to provide order and diversity and avoid a jumbled, confused development.
- Whenever possible, new structures should be clustered. This creates plazas or pedestrian malls and prevents long "barracks-like" rows of structures. When clustering is impractical, a visual link between separate structures should be established. This link can be accomplished through the use of an arcade system, trellis, or other open structure. (Refer to Figure 1).
- Locate structures and on-site circulation systems to minimize

pedestrian/vehicle conflicts. Link structures to the public sidewalk with textured paving,

**Figure 1**

- landscaping, and trellises.
- Outdoor spaces should have clear, recognizable shapes that reflect careful planning and are not simply "left over" areas between structures. Such spaces should provide pedestrian amenities such as shade, benches, fountains, etc.
- Freestanding, singular commercial structures should be oriented with their major entry toward the street where access is provided, as well as having their major facade parallel to the street.
- When it is not possible to locate loading facilities at the rear of the building, loading docks and doors should not dominate the frontage and must be screened from the street. Loading facilities should be offset from driveway openings.

- Open space areas should be clustered into larger, landscaped areas rather than equally distributing them into areas of low impact such as at building peripheries, behind a structure or areas of little impact to the public view that are not required as a land use buffer or as a required yard setback.

### **Parking and circulation:**

Parking lot design can be a critical factor in the success or failure of a commercial use. In considering the possibilities for developing a new parking area, a developer should analyze the following factors: ingress and egress with consideration to possible conflicts with street traffic; pedestrian and vehicular conflicts; on-site circulation and service vehicle zones; and the overall configuration and appearance of the parking area.

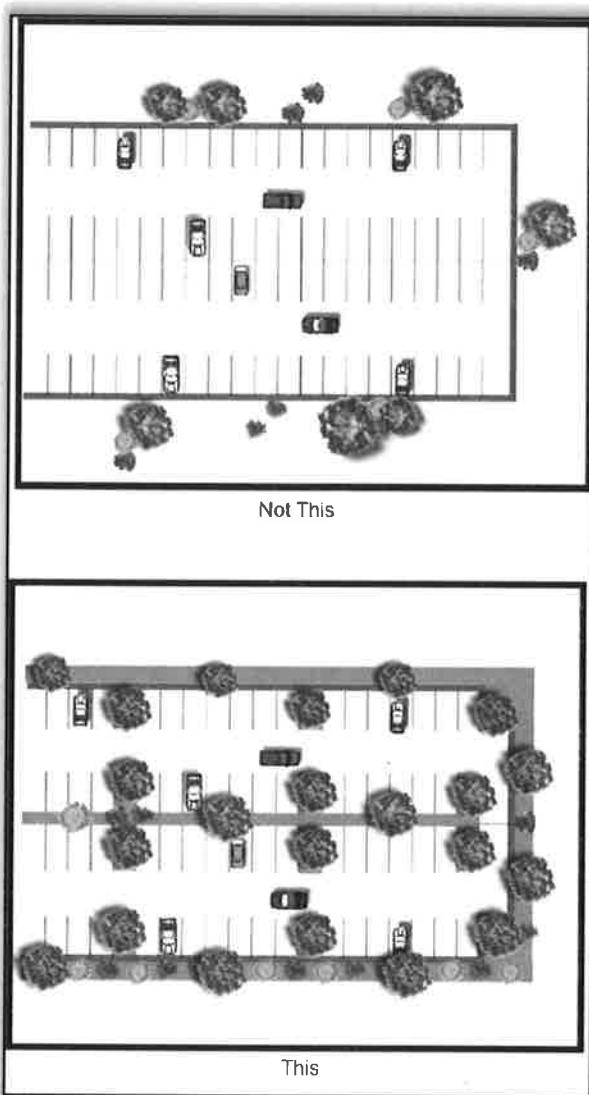

**Figure 2**

- Buildings should generally be oriented parallel to streets and should be placed as close to the

street as required setbacks and consistent building placement will permit. (Refer to Figure 2).

- Separate vehicular and pedestrian circulation systems should be provided. Pedestrian linkages between uses in commercial developments should be emphasized, including distinct pedestrian access from parking areas in large commercial developments, such as shopping centers.
- Common driveways which provide vehicular access to more than 1 site are encouraged.
- Shared parking between adjacent businesses and/or developments is required whenever practical.
- Parking areas should be separated from structures by either a raised concrete walkway or landscaped strip, preferably both. Situations where parking spaces directly abut structures should be avoided.
- Where parking areas are connected, direction of travel and parking bays should be similar to reduce conflict at points of connection.
- Parking access points, whether located on front or side streets must be located as far as possible from street intersections so that adequate stacking room is provided. The number of access points should be limited to the minimum amount necessary to provide adequate circulation.

- Parking areas which accommodate a significant number of vehicles should be divided into a series of connected smaller lots.
- The visual impact of parking lots should be minimized by locating these facilities to a portion of the site least visible from the street. Parking areas must be landscaped, receiving interior as well as perimeter treatment. (Refer to Figure 3).

**Figure 3**

- Pedestrian walkways located in parking areas should be visible from structures. This can be accomplished by using design features such as walkways with enhanced paving, trellis structures, or a special landscaping treatment.
- Linkages from the structures should be provided for pedestrian access to public sidewalks.
- Design parking areas so that pedestrians walk parallel to moving cars. Minimize the need for the pedestrian to cross parking aisles and landscape areas.
- The parking stalls which are perpendicular to a driveway or first aisle juncture, should be set back a sufficient distance from the curb to avoid traffic obstruction. With larger centers, significantly more setback area may be required.
- Drive aisle throats should be of sufficient depth to avoid vehicle stacking into the street.
- Utilize an opaque wall or landscaping to screen any parking at the street periphery. A combination of walls, berms, and landscape material is recommended. Changing the grade of the parking lot from existing street elevations may aid in obscuring views of automobiles while promoting views of

architectural elements of the structures beyond.

### **Landscaping:**

Commercial uses typically have more hardscape and building coverage, resulting in smaller landscape areas than other types of land uses. Landscaping has a variety of functions, including softening the hard edges of development, screening unattractive views, buffering incompatible uses, providing shade and increasing the overall identity for the project.

- Landscaping for commercial uses should define entrances to buildings and parking lots, define the edges of various land uses, provide transition between neighboring properties (buffering), and provide screening for loading and equipment areas.
- Landscaping should be in scale with adjacent structures and be of appropriate size at maturity to accomplish its intended purpose.
- At maturity, trees should provide a shade canopy for all parking areas. (Refer to Figure 4)

**Figure 4**

- Trees should be located throughout the parking lot and not simply at the ends of parking aisles.
- Landscaping around the entire base of buildings is recommended to soften the edge between the parking lot and the structure. (Refer to Figure 5) Landscaping should accent building entrances to provide a focal point.

**Figure 5**

- The use of vines and climbing plants on buildings, trellises, and perimeter garden walls is strongly encouraged.
- Plants in boxed, clay or wood containers should be used for enhancement of sidewalk shops, plazas, and courtyards.
- At maturity, trees should provide a shade canopy for all parking areas.
- Landscaping should be protected from vehicular and pedestrian encroachment by raised planting

surfaces, depressed walks, or the use of curbs.

- Landscaping should not obstruct visibility at drive aisle intersections.

### **Walls & Fences:**

The fact that commercial uses often require large outdoor areas for activities, parking or storage necessitates the thoughtful design of surrounding walls and fences because they can become significant visual elements on the site. It is of primary importance to take into account the public street frontage impact of walls and fences.

**Figure 6**

- Where walls are used at property frontages, or screen walls are used to conceal storage, they should be designed to blend with the site's architecture. Landscaping should be used in combination with such walls whenever possible. (Refer to Figure 6)
- Security fencing and long expanses of fence or wall surfaces should be offset and

architecturally designed to prevent monotony. Landscape pockets should be provided.

- If not required for a specific screening, security or separation of incompatible land uses, walls should not be utilized within commercial areas.

### **Screening:**

Screening can protect and separate uses and site functions to decrease adverse noise, wind, or visual impacts and to provide privacy. The need for screening should be considered early in the design process so that screening elements (such as fences and walls, berms, and landscaping) can be effectively integrated into the overall project design and not added later as an afterthought.

- When allowed, exterior storage should be confined to portions of the site least visible to public view. Where screening is required, a combination of elements should be used including solid masonry walls, berms, and landscaping. Chainlink fencing with wood or metal slatting is not permitted when visible from the public right-of-way.
- Any outdoor equipment, whether on a roof, side of a structure, or on the ground, must be appropriately screened from view. The method of screening must be architecturally integrated with the adjacent structure or properly landscaped (Refer to Figure 7). Where individual

equipment is provided, a continuous screen is desirable.

*Figure 7*

### **Architectural Design:**

Architectural design addresses the exterior of buildings and their relationship to the surrounding built context. It is paramount to ensure that the design of the building complements the community setting and character and contributes to the public realm.

- Heights of structures should relate to adjacent open spaces to allow maximum natural light and ventilation, protection from prevailing winds, enhance public views and minimize obstruction of view from adjoining structures.
- Height and scale of new developments should be compatible with that of surrounding developments. The developments should “transition” from the height of adjacent development to the maximum height of the proposed structure.
- Vary the planes of the exterior walls in depth and/or direction.

Wall planes should not run in a continuous direction for more than 50 feet without an offset.

- Vary the height of the buildings so that it appears to be divided into distinct massing elements.
- Articulate the different parts of a building's facade by use of color, arrangement of facade elements, or a change in materials.
- Avoid blank walls at the ground floor levels. Utilize windows, trellises, wall articulation, arcades, change in materials, landscaping or other features to lessen the impact of an otherwise bulky building (*Refer to Figure 8*).

*Figure 8*

- The rear and side elevations should incorporate some of the architectural features of the main facade.

### **Scale:**

Scale is the relationship between the size of the new structure and the size of adjoining permanent structures. Large scale building elements will appear

imposing if they are situated in a visual environment which is predominantly smaller in scale.

- Building scale can be reduced through the proper use of window patterns, structural bays, roof overhangs, siding, awnings, moldings, fixtures, and other details (Refer to Figure 9).

**Figure 9**

- The scale of buildings should be carefully related to adjacent pedestrian areas (e.g. courtyards) and other structures.
- Large dominating structures should be broken up by: 1) creating horizontal emphasis through the use of trim; 2) adding awnings, eaves, windows, or architectural ornamentation; 3) use of combinations of complementary colors; and 4) landscape materials.

### **Color:**

The exterior colors of a building are as important as the materials in determining how people think about the building and its surroundings. Colors should be compatible with the existing

colors of the surrounding area but need not duplicate existing colors.

- Accent colors should be used thoughtfully and compliment the base color or a variation of its hue, either weaker or stronger.
- The transition between base and accent colors should relate to changes in building materials or the change of building surface planes. Colors should generally not meet or change without some physical change or definition to the surface plane.
- The use of muted tones for the structure's base color is recommended. Color should not be used as an attention getting device (Refer to Figure 10).

**Figure 10**

### **Roofs & Awnings:**

Roof design contributes strongly to the image of a structure as having quality and permanence.

- The roofline at the top of the structure should incorporate offsets and jogs to reduce the monotony of an uninterrupted roof plane.

- When more than one awning is used on a single structure, they should be of the same form and color. Awnings should complement the architectural style of the building (Refer to Figure 11).

**Figure 11**

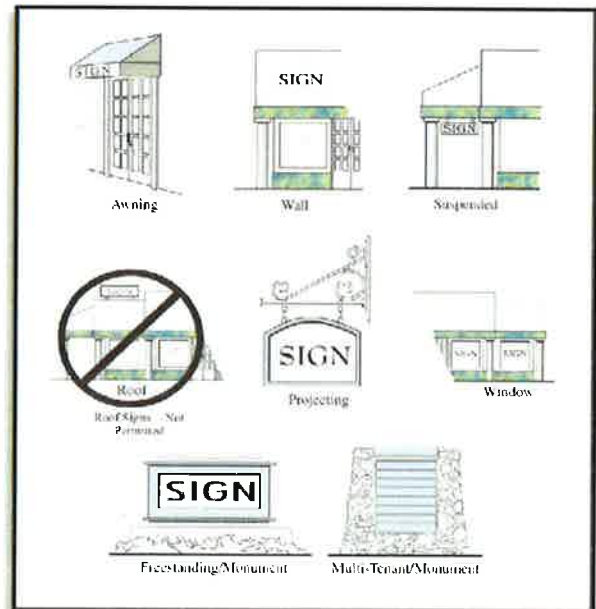

- All roof top equipment must be screened from public view by materials of the same nature as the main structure. Mechanical equipment should be located below the highest vertical element of the building.
- Corrugated metal or highly reflected roofing materials should not be used.
- Flat roofs are appropriate for larger commercial structures when it is determined that a project's overall design is amenable to flat roofs and is otherwise consistent with the objectives of these guidelines.
- Mansards should be used only to the extent that they maintain the same roof pitch as surrounding

structures and are both high and deep enough to create the illusion of being a true roof. Steeply-pitched mansard roofs are discouraged.

**Signs:**

Every structure should be designed with specific consideration for adequate signing, including provisions for sign placement, sign scale in relation to building scale, and readability. However, building facades designed solely for the placement of signs is strongly discouraged. The colors, placement, and materials of all signs should be integrated with the architecture and façade details of the structure.

These guidelines are intended to supplement and compliment the City's sign regulations provided in Title 17 of the Atwater Municipal Code. (Refer to Figure 12)

**Figure 12**

- The colors and materials of signs should complement the architectural style of the building.

- Signing should be consistent in location and design throughout a development. The development of a signage program is highly recommended for shopping centers, to encourage uniformity.
- When more than one type of sign is used in a project, the styles of the signs should be consistent with one another so that the effect of the overall program is harmonious.
- Illumination. Lighting for signs should not create a hazardous glare for pedestrians or vehicles either in a public street or on any private premises. The light source should be shielded from view and excessive light spillage should be avoided.
- Lighting for externally illuminated signs should be indirect and utilize focused light fixtures that do not allow light or glare to shine above the horizontal plane of the top of the sign or onto any public right-of-way or adjoining property.

**Lighting:**

Lighting provides safety and orientation, but may also be a nuisance when it intrudes unnecessarily onto surrounding properties or the street. Conversely, lighting can enhance the aesthetic qualities of commercial development when used to complement its form and character and to create ambiance.

- Lighting should be designed to illuminate at the minimum level necessary for safety and security, and to avoid harsh contrasts in lighting levels between the

project and adjacent properties to the maximum extent possible. In all cases lighting should be designed to minimize glare by, among things, recessing the light within the fixture. (Refer to Figure 13)

**Figure 13**

- Lighting fixtures should not appear as an afterthought but should be integrated with the design of the buildings, parking and landscaping.
- Lighting fixtures in parking lots should be located to assure adequate light levels and to avoid displacing trees.
- The design, size, and placement of outdoor lighting fixtures on buildings and in parking lots should be in keeping with the architectural style of the buildings. More, smaller-scale parking lot lights instead of fewer, overly tall and large parking lot lights should be installed. Outdoor light fixtures mounted on building walls should relate to the height of pedestrians.

## **Industrial Guidelines:**

### **Purpose:**

These design guidelines are intended as a reference to assist the designer in understanding the City's goals and objectives for high quality industrial development. These guidelines complement the mandatory property development regulations by providing good examples of potential design solutions and by providing design interpretations of the various mandatory regulations.

### **Applicability:**

These guidelines are advisory for permitted uses but should be used in conjunction with uses such as Tentative Maps, Conditional Use Permits or Planned Development proposals, to encourage the highest level of design quality while at the same time providing the flexibility necessary to encourage creativity on the part of project designers.

### **Site Planning Principles:**

The following guidelines address the overall approach to industrial project design favored by the City.

- A variety of building and parking setbacks should be provided to avoid long monotonous building facades and to create diversity within the project.
- Buildings should be located on "open space islands", which may be formally landscaped or set in a natural open space environment. The main entrance of the building

should not directly abut the paved parking area. A minimum landscape strip should be provided between parking areas and the portions of the buildings where parking is provided.

- Building setbacks should be provided proportionate to the scale of the structure and in consideration of existing adjacent development. Larger structures require more setback area for a balance of scale and so as not to impose visually on neighboring uses.
- The placement of structures to create plazas, courts, or gardens is encouraged. Setback areas can often be used to provide space for patio and outdoor seating areas. (Refer to Figure 14)

**Figure 14**

- Site access should be easily identifiable and provide convenient access, visitor parking and good on-site circulation.
- Emphasis on main building entry. Service areas should be located at the side and rear of buildings.

- Landscaped open space to soften the transition between parking and the buildings and to provide gathering places for employees.
- Multiple buildings clustered on the same site to create a campus-like setting that takes advantage of shared open space and pedestrian amenities.

### **Industrial Building Design:**

The inherently utilitarian nature of industrial buildings need not prevent the design of attractive industrial areas within the city. The architectural style of buildings in the business park/industrial zoning should incorporate clean simple lines. Buildings should project an image of high quality through the use of appropriate durable materials such as smooth plaster, stucco, brick, or masonry and well landscaped settings.

Mass and scale: As a category of structure type, typically bland industrial buildings often present unattractive, unadorned, "box-like" forms. A variety of design techniques should be used to help overcome this situation and to produce a cohesive design statement.

- Entries to structures should portray a quality appearance while being architecturally tied into the overall building composition and scale.
- Blank walls between breaks in the building facade should be avoided especially where visible from streets and walkways.

- Provide articulated facades with offsets and recessed entries. (Refer to Figure 15)

**Figure 15**

- Alteration of colors, textures and materials should be used to produce diversity and enhance architectural forms. A compatible variety of siding materials (i.e. masonry, concrete texturing, cement or plaster) should be used to produce effects of texture and relief that provide architectural interest.

Undesirable Elements: Design elements which are undesirable and should be avoided include:

- Large blank, unarticulated wall surfaces.
- Exposed, untreated precision block walls.
- False fronts.
- Steeply pitched mansard roofs, materials with high maintenance (stained wood, shingles or light gauge metal siding).
- Loading bays or doors facing the street.

**Figure 16**

- Chain link fence and barbed wire / razor wire. (Refer to Figure 16)
- Exposed roof drains and downspouts, except where integrated with the colors, materials and other details of the building architecture.

**Roofs:** Roof design contributes strongly to the image of a structure as having quality and permanence.

- Unless roofing materials are a part of the design element (for example, tiles, concrete or metal roofing elements), the ridge line elevation should not exceed the parapet elevation.
- Piecemeal mansard roofs (used on a portion of the building perimeter only) should be avoided. Mansard roofs should wrap around the entire perimeter of the structure.
- Rooftop equipment should be screened from view of parking areas, walkways and streets through the use of parapets or enclosures consistent with the architectural character of the

building.

**Parking Lot and Loading Areas:**

Parking lots should not be the dominant visual elements of the site. Large expansive paved areas located between the street and the building are to be avoided in favor of smaller multiple lots separated by landscaping and buildings and located to the sides and rear of buildings whenever possible.

- Site access and internal circulation should be designed in a straight forward manner which emphasizes safety and efficiency. The circulation system should be designed to reduce conflicts between vehicular and pedestrian traffic. (Refer to Figure 17)

**Figure 17**

- Entrances and exits to and from parking and loading facilities should be clearly marked with appropriate directional signage where multiple access points are provided.
- Parking lots adjacent to and visible from public streets should

be adequately screened from view through the use of rolling earth berms which accommodate drainage, low screen walls, changes in elevation, landscaping or combinations thereof.

**Loading Facilities:** Loading bays are key elements of the function of many industrial buildings, but can be problematic in creating an overall building design that is attractive from the public view.

- To alleviate the unsightly appearance of loading facilities for industrial uses, these areas should not be located at the front of buildings where it is difficult to adequately screen them from public view. Loading facilities are generally more appropriate at the rear of the building where they are more functional and can be more effectively screened. (Refer to Figure 18)

**Figure 18**

- When site features prevent the placement of loading facilities at the rear of the building, loading docks and doors may be at the side of the building but should be screened from view by a

combination of screen walls, ornamental landscaping and/or portions of the building. Gates should be located so as not to allow views from the public right-of-way into loading areas.

- Rolling shutter doors located on the inside of the building are the preferred method for providing large loading doors while keeping a clean, uncluttered appearance from the exterior.
- Loading areas should be designed so that trucks will not need to back- in from the public street onto the site. These maneuvers are unsafe, and should not be utilized except under extenuating circumstances.

### **Landscaping:**

Landscaping should be used on industrial sites to define areas such as entrances to buildings and parking lots, define the edges of various land uses, provide transition between neighboring properties (buffering), and provide screening for outdoor storage, loading and equipment areas.

- Landscaping should be in scale with adjacent buildings and be of appropriate size at maturity to accomplish its intended purpose.
- Landscaping around the entire base of buildings is recommended to soften the edge between the parking lot and the structure and the view of the structure from the public right-of-way. Landscaping should accent building entrances to provide a

focal point.

- Use berming at the edge of the building in conjunction with landscaping to reduce the apparent height of the structure and its mass, especially along street frontages.
- Use of vines on walls is appropriate in industrial areas because such walls often tend to be large, blank and potentially subjected to graffiti. (Refer to Figure 19)

**Figure 19**

- Development in areas with native vegetation or located within unique environments are encouraged to use landscape designs and materials which are sensitive to and compatible with existing vegetation.
- Trees should be located throughout the parking lot and not simply at the ends of parking aisles.
- Plants should be drought tolerant and suitable to the climate of the Atwater area.

#### Water Efficient Landscaping:

- All landscaping shall employ features and techniques that in the aggregate reduce the demand for and consumption of water, including appropriate low water using plants, non-living ground cover, a low percentage of lawn coverage, a high degree of paving permeability and water conserving irrigation techniques and systems.
- The use of turf should be minimized or substituted altogether with groundcovers. Turf should be excluded from median or sidewalk strips and other areas which are difficult to irrigate and maintain. Low-water-using grass varieties are encouraged.
- Water efficient irrigation systems, such as drip, low output sprinkler heads, zonal systems and automatic timers, should be provided. Planting should be according to water needs, and the irrigation system matched to these needs.
- Plant varieties should be low water consuming, suited to the local soil and climate and grouped according to their water requirements. For instance, sprinklers for turf areas should be installed with a separate irrigation valve from irrigation valves used for other vegetation.

#### Screening:

The nature of some industrial uses and their sites may inevitably result in

unsightly features. In these cases, screening features should be carefully designed so that their appearance is not equally unattractive.

- Where permanent screening is required between a business park / industrial zone and a residential zone, a decorative, solid masonry screening wall is required. Evergreen landscaping should be placed adjacent to the wall and vines should be planted at the base of the wall so when mature the wall is not visible. (Refer to Figure 20)

**Figure 20**

- Exterior storage and loading areas should be confined to portions of the site least visible to public view where screening needs are minimized.
- Where screening is required, a combination of elements should be used including solid masonry walls, berms, and landscaping.
- Any equipment, whether on the roof, side of building, or ground, should be screened. The method of screening should be architecturally integrated with the

building design in terms of materials, color, shape, and size. Where individual equipment is provided, a continuous screen is desirable.

### **Lighting:**

Lighting provides safety and orientation, but may also be a nuisance when it intrudes unnecessarily onto surrounding properties or the street. Conversely, lighting can enhance the aesthetic qualities of industrial development when used to complement its form and character and to create ambiance.

- Lighting should be designed to illuminate at the minimum level necessary for safety and security, and to avoid harsh contrasts in lighting levels between the project and adjacent properties to the maximum extent possible. In all cases lighting should be designed to minimize glare by, among things, recessing the light within the fixture.
- Lighting fixtures should not appear as an afterthought but should be integrated with the design of the buildings, parking and landscaping. (Refer to Figure 21)

**Figure 21**

- Lighting fixtures in parking lots should be located to assure adequate light levels and to avoid displacing trees.
- The design, size, and placement of outdoor lighting fixtures on buildings and in parking lots should be in keeping with the architectural style of the buildings. More, smaller-scale parking lot lights instead of fewer, overly tall and large parking lot lights should be installed. Outdoor light fixtures mounted on building walls should relate to the height of pedestrians. (Refer to Figure 22)

**Figure 22**

### **Signs:**

Every structure should be designed with a precise concept for adequate signing. Provisions for sign placement, sign scale in relation to building scale, and the readability of the sign should be considered in developing the overall project's signing concept.

- Signs are an essential communications tool for business

and the public. The primary role of signs should be to identify, not advertise. Compliance with the design guidelines will result in signage that effectively communicates a message, speeds the review process, and contributes to the visual quality of the community.

- All signs should be highly compatible with the structure and site design relative to color, material, and placement.
- Monument-type signs are preferred for business identification; pole signs should be avoided. Where several tenants occupy the same site, individual wall mounted signs are appropriate in combination with a monument sign identifying the business park complex and address.
- The industrial site should be appropriately signed to give directions to loading and receiving areas, visitor parking and other special areas.

**GENERAL NOTES**

1. THE PRIMARY CALCULATED SITE PLAN SHALL BE USED FOR THE PURPOSES OF PERMITTING ONLY.
2. THIS PROJECT SHALL ADHERE TO ALL TERMS AND CONDITIONS AS OUTLINED IN THE EPA OR APPLICABLE STATE GENERAL PERMIT FOR CONSTRUCTION ACTIVITIES ASSOCIATED WITH CONSTRUCTION ACTIVITIES.
3. ALL PROPOSED SEDIMENT SHALL HAVE A MAXIMUM CROSS-SLOPE OF 2%.
4. POSITIVE DRAINAGE AWAY FROM BUILDING SHALL BE A MINIMUM OF 1% UNLESS OTHERWISE NOTED.
5. THE PROJECT SITE IS LOCATED WITHIN FLOOD ZONE X-1 AND IS SUBJECT TO FLOODING DURING 12/22/08 FOR MODELS SCENARIY COMMUNITY NUMBER 020158.
6. ALL PROPOSED CONSTRUCTION SHALL BE PER CITY OF ATWATER STANDARDS AND SPECIFICATIONS UNLESS OTHERWISE NOTED.

**SITE INFORMATION**

1. SITE USES INCLUDE RETAIL, RAIL, OUTLET AND UNCOVERED PARKING.
2. SURFACE INFORMATION:
  - A. TOTAL AREA OF SITE: 0.408 ACRES (ON-SITE) 0.408 ACRES (OFF-SITE)
  - B. TOTAL DISTURBED AREA OF SITE: 0.408 ACRES
  - C. PERVIOUS VS IMPVIOUS TABLE: SEE TABLE THIS SHEET
  - 3. POST-CONSTRUCTION CATEGORIES: RECALCULATED PROJECT
  - 4. DRAINAGE MANAGEMENT AREAS: SEE PLAN VIEW - LEFT

**BMP INFORMATION**

1. SELECTED POST-CONSTRUCTION BMPs:
  - A. SOURCE CONTROL MEASURES: COVERED WASTE AREA GRADES TO PREVENT RUN-OFF. THIS AREAS COVERED BY CANOPY AND DRAINED TO PREVENT WASTEWATER FROM BEING DISCHARGED TO ADJACENT WATERSHEDS. MINIMUM SLOPED TO STORM LANDSCAPE TO PREVENT CLOSING TREES AND SHRUBS TO MAXIMUM EXTENT. ANY WATER SUPPLY AREA GRADED TO PREVENT RUN-OFF. ALL DRAIN INLETS TO BE MARKED "NO DRINKING WATER".
  - B. LAD DESIGN STANDARDS: DEVELOPMENT TO BE CONCENTRATED ON LESS PERVIOUS SOILS AND PRESERVE AREAS THAT CAN PROMOTE INFILTRATION. IMPVIOUS AREAS TO BE PRESERVED TO THE MAXIMUM EXTENT. NATURAL DRAINAGE PATTERNS AND VEGETATION SHALL BE MAINTAINED AND WHERE APPROPRIATE THE SITE EXCESSIVE GRADING PRESERVE SENSITIVE TREES.
  - C. SITE DESIGN MEASURES: TREE PLANTING AND PRESERVATION
  - D. TREATMENT CONTROL MEASURES: 80%-RETENTION PLANTERS
  - E. ALLOWABLE DESIGN MARKINGS: APPROVED - MINIMUM DIMENSIONS FOR 80%-RETENTION PLANTERS
2. HYDROMORPHIC MANAGEMENT MEASURES: SEE TREATMENT CONTROL TABLE
3. HYDROMORPHIC MANAGEMENT MEASURES: 80%-RETENTION PLANTERS/TREE PLANTING AND PRESERVATION PRE-PROJECT FLOW RATE=0.336 CFS (2 HR, 24 HR STORM EVENT) NOT APPLICABLE
4. DRAINAGE ASSESSMENT BY METHOD: SEE PLAN VIEW - LEFT

### SITE INFORMATION

- SITE USES INCLUDE RETAIL FUEL OUTLET AND UNCOVERED PARKING
- SURFACE INFORMATION:
  - TOTAL AREA OF SITE: 6.404 ACRES (ON-SITE) 6.086 ACRES (OFF-SITE)
  - TOTAL DISTURBED AREA OF SITE: 5.493 ACRES
  - REFERENCE AS IMPROVISED TABLE: SEE TABLE THIS SHEET
  - POST-CONSTRUCTION CATEGORY: REGULATED PROJECT
  - DRAINAGE MANAGEMENT AREAS: SEE PLAN NEW - LEFT

### BMP INFORMATION

- SELECTED POST-CONSTRUCTION BMP'S:
  - SOURCE CONTROL MEASURES: COVERED WASTE AREA GRADED TO PREVENT RUN-ON THE EXISTING AREA COVERED BY COMPOST AND GRADED TO PREVENT RUN-ON THE EXISTING AREA COVERED BY COMPOST AND GRADED TO PREVENT MINIMUM SPECIFIED SLOPE. LANDSCAPE TO PREVENT EXISTING TREES AND SHRUBS TO MAXIMUM EXTENT. AIR FILTER STRIP AREA GRADED TO PREVENT RUN-ON. ALL DRAIN PIPES TO BE BURIED. NO DRAINAGE.
  - LEI DESIGN STANDARDS: DEVELOPMENT TO BE CONCENTRATED ON LESS PERMEABLE SOILS AND PRESERVE AREAS THAT CAN PROMOTE NITRIFICATION. IMPROVISED TABLE TO BE USED TO DETERMINE SLOPE. LANDSCAPE TO PREVENT EXISTING TREES AND SHRUBS TO MAXIMUM EXTENT. AIR FILTER STRIP AREA GRADED TO PREVENT RUN-ON. ALL DRAIN PIPES TO BE BURIED. NO DRAINAGE.
- TREATMENT CONTROL MEASURES:
  - IMPACTED - MINIMUM DIMENSIONS FOR BIO-RETENTION PLANTERS: SEE TREATMENT CONTROL TABLE
  - HYPERMEDIATION CONTROL: SEE TREATMENT CONTROL TABLE
  - HYPERMEDIATION CONTROL MEASURES: BIO-RETENTION PLANTERS/TREE PLANTING AND PRESERVATION PRE-PROJECT FLOW RATE=0.316 GPM (2 IN. 24 IN. STORM EVENT) NOT APPLICABLE
  - POINT OF CONNECTION: SEE PLAN NEW - LEFT
